CHEMISTRY

THEORY

PAPER 3

MARKING SCHEME

INSTRUCTIONS TO CANDIDATES

- Write your name and index number in the spaces provided above.
- Answer ALL the questions in the spaces provided in the question paper.
- You are NOT allowed to start working with the apparatus for the first 15 minutes of the 2 ½ hours allowed for this paper. This time is to enable you to read the question paper and make sure you have all the chemicals and apparatus that you may need.
- All working MUST be clearly shown where necessary
- Mathematical tables and electronic calculators may be used.

FOR EXAMINER'S USE ONLY

QUESTION	MAX. SCORE	SCORE-----
1	20	
2	14	
3	6	
TOTAL SCORE	40	

1. You are provided with: -
 - 4.5g of solid A in a boiling tube.
 - Solution B, 0.06M acidified Potassium manganate (VII)

You are required to determine

- (1) The solubility of solid A at different temperatures.
- (2) The number of moles of water of crystallization in solid A.

PROCEDURE

- (a) Using a burette, add 4cm³ of distilled water to solid A in the boiling tube. Heat the mixture while stirring with the thermometer to about 70⁰C. When the entire solid has dissolved, allow the solution to cool while stirring with the thermometer. Note the temperature at which crystals of solid A first appear. Record this temperature in table 1.
- (b) Using the burette, add 2cm³ of distilled water to the contents of the boiling tube. Warm the mixture while stirring with the thermometer until all the solid dissolves. Allow the mixture to cool while stirring. Note and record the temperature at which crystals of solid A first appear.
- (c) Repeat procedure (b) two more times and record the temperatures in table I. Retain the contents of the boiling tube for use in procedure (e)
- (d) (i) Complete table 1 by calculating the solubility of solid A at the different temperatures. The solubility of a substance is the mass of the substance that dissolves in 100cm³ (100g) of water at a particular temperature. (6 marks)

Table 1

Volume of water in the boiling tube (cm ³)	Temperature at which crystals of solid A first appear (⁰ C)	Solubility of solid A (g/100g water)
4	70	112.5
6	59	75
8	51	56.25
10	46	45

(ii) On the grid provided, plot a graph of the solubility of solid A (vertical axis against temperature). (3 marks)

(iii) Using your graph, determine the temperature at which 100g of solid A would dissolve in 100cm³ of water. (1 mark)

$$67^{\circ}\text{C} \pm 5$$

(e) (i) Transfer the contents of the boiling tube into a 250ml volumetric flask. Rinse both the boiling tube and the thermometer with distilled water and add to the volumetric flask. Add more distilled water to make up to the mark. Label this solution A. Fill a burette with solution B. Using a pipette and a pipette filler, place 25.0cm³ of solution A into a conical flask. Warm the mixture to about 70⁰C. Titrate the hot solution A with solution B until a permanent pink colour persists. Record your readings in table 2. Repeat the titration two more times and complete table 2. (Retain the remaining solution B for use in question 3).

Table 2

	I	II	III
Final burette reading			
Initial burette reading			
Volume of solution B used (cm ³)	20.8	20.6	20.7

(3 marks)

(ii) Calculate the:

I. Average volume of solution B used. (1 mark)

$$AV = 20.7$$

II. Number of moles of potassium manganate (VII) used. (1 mark)

$$\frac{20.7 \times 0.06}{100} = 0.001242 \text{ moles}$$

$$100$$

$$\text{Ans (ii)} \frac{1 \times 0.06}{100}$$

III. Number of moles of A 25cm³ of solution A given that 2 moles of potassium manganate (VII) react completely with 5 moles of A. (1 mark)

$$\begin{array}{l} \text{K Mn O}_4 : \text{A} \\ 2 : 5 \\ \hline 0.001242 : 5 \times 0.001242 = 0.003105 \text{ moles} \\ \hline \text{Ans} \end{array}$$

VI. Relative formula mass of A. (2 marks)

$$\begin{array}{l} 25 \text{ cm}^3 \rightarrow 0.003105 \\ \therefore 250 \text{ cm}^3 \rightarrow \frac{250 \times 0.003105}{25} = 0.03105 \text{ moles.} \\ \hline 0.03105 \text{ moles} \rightarrow 4.5 \text{ g} \\ \hline \text{mole} \rightarrow \frac{1 \times 4.5}{0.03105} = 144.93 \\ \hline \text{(Ans)} \end{array}$$

- (iii) The formula of A has the form $D \cdot xH_2O$. Determine the value of x in the formula given that the relative formula mass of D is 90.0 and atomic masses of oxygen and hydrogen are 16.0 and 1.0 respectively.

$D + 18x = 144.93$	(2mks)
$90 + 18x = 144.93$	$x = 54.93$
$18x = 144.93 - 90$	18
$18x = 54.93$	$= 3.05$
$x = 3$	≈ 3

2. You are provided with 10cm^3 P. Solution P contains two cations and one anion. Carry out the tests below and record your observations and inferences in the spaces provided.

(a) Add 20cm^3 of 2M aqueous sodium hydroxide to all of solution P provided. Shake well filter the mixture into conical flask. Retain both and the residue.

(b)

Observations	Inferences
<ul style="list-style-type: none"> - Blue ppt/residue - Colourless filtrate <p style="text-align: right;">(1 mark)</p>	<ul style="list-style-type: none"> - Cu^{2+} present <p style="text-align: right;">(1 mark)</p>

(b) (i) To about 2cm^3 of the filtrate, add 2m nitric acid dropwise until in excess (i.e. about 1cm^3 of the acid). Retain the mixture.

Observations
<ul style="list-style-type: none"> - White ppt formed - Soluble in excess acid <p>(1 mark)</p>

Divide the mixture in b(i) above into two portions.

(ii) To the first portion, add aqueous sodium hydroxide dropwise until in excess.

Observations	Inferences
<ul style="list-style-type: none">- White ppt formed- Soluble in excess (1 mark)	Pb^{2+} or Al^{3+} , Zn^{2+} present (2 marks)

(iii) To the second portion, add aqueous ammonia dropwise until in excess.

Observations	Inferences
White ppt formed insoluble in excess (1 mark)	Al^{3+} or Pb^{2+} present (1 mark)

(c) To 2cm^3 of the filtrate, add 3 drop of potassium iodide solution.

Observations	Inferences
No yellow ppt formed (1 mark)	Al^{3+} present Pb^{2+} Absent (1 mark)

(d) To 2cm^3 of filtrate, add 3 drops of acidified barium nitrate solution.

Observations	Inferences
White ppt formed (1 mark)	SO_4^{2-} present (1 mark)
